Cross Roads Safety

Pedestrians are the high-risk group on roads. Most of the accidents and accidental deaths involving pedestrians are the direct result of their errant behaviour, especially while crossing roads. They are least bothered about the right of vehicles on roads and scuttle across roads amidst heavy traffic without giving due respects to road safety norms.

Pedestrians should keep the following in mind

- The first right on roads is that of vehicles, hence give way to them
- Utilise zebra crossings, subways and foot overbridges to cross roads instead of cutting it in the middle

Zebra Crossings

Every pedestrian must have seen a group of white lines as those on a zebra near intersections where vehicles stop at red light. These

are exclusively meant for pedestrians for their safe crossover. They should cross the road by walking over it. Only when the traffic signal for vehicles is green do vehicles drive over zebra crossing.

Subways

Technology tunnels involving great engineering skills and expenditure are built underneath roads to enable pedestrians cross busy roads safely without confronting heavy onrush of

traffic on roads. It is not only safe to cross roads using a subway it is fun too. For you can have a leisure walk without any botheration for traffic.

Overhead Bridges

On certain busy roads wherein construction of subway is not feasible overhead bridges are built

across road edges to enable pedestrians safe crossover. Again, using these bridges to cross roads would be safe as well as fun. For you are quite above from the realities on roads!
